

Importing Data

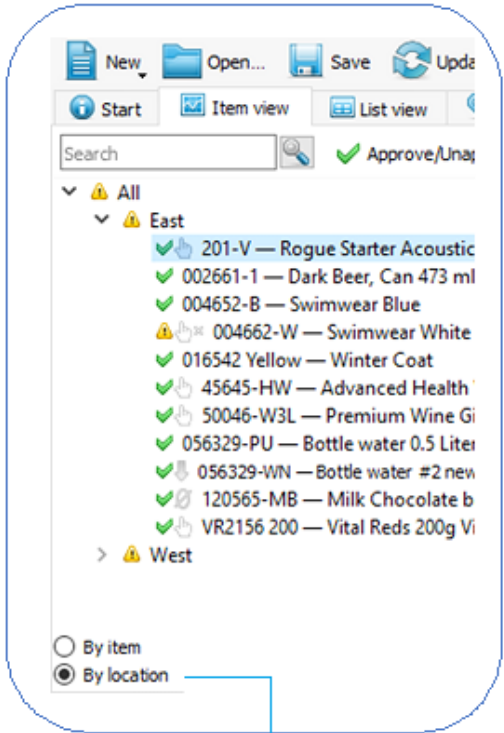

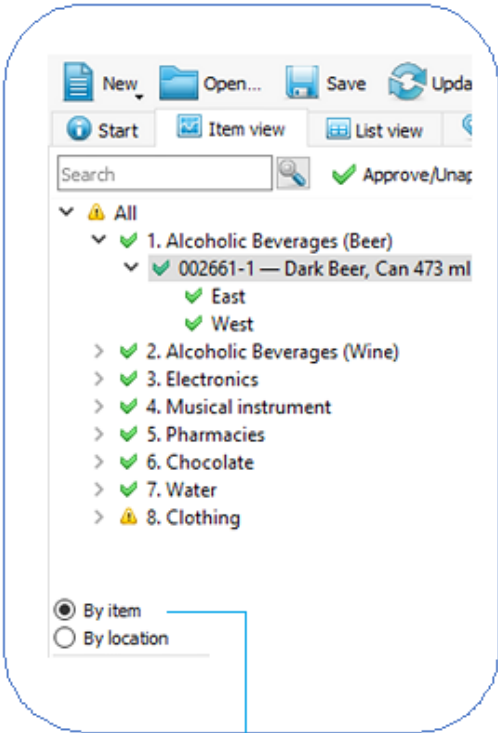

To import data, please complete the following steps.

For effective analysis, **Streamline** allows to construct hierarchical *data "tree"*. If for sales forecasting/inventory planning the number of locations is important, then construct the data "tree" based on locations. Otherwise, construct a data "tree" based on item categories and item specifications.

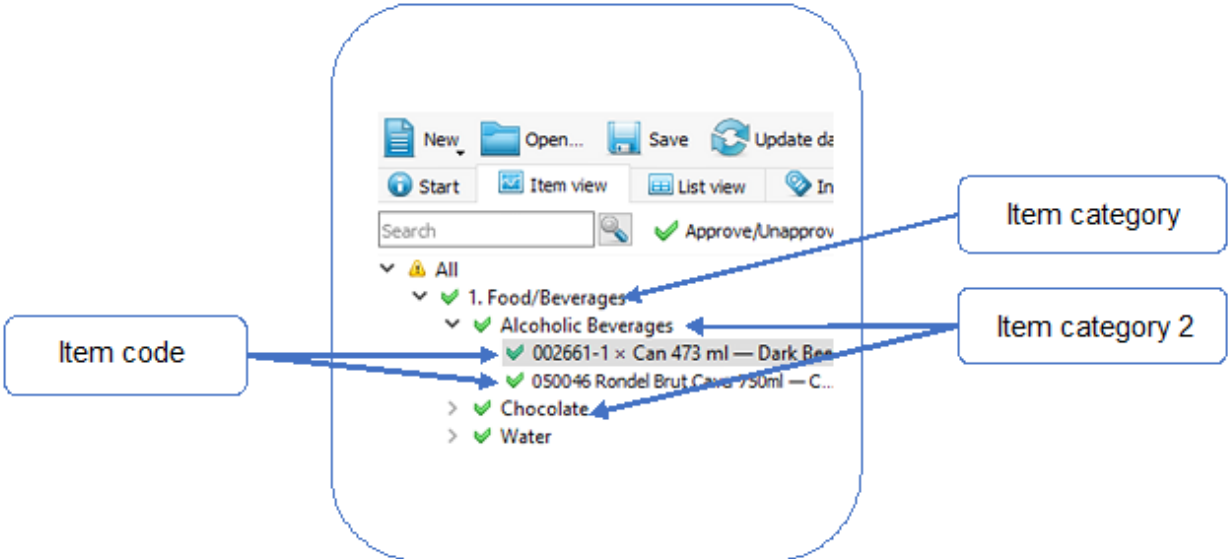

The hierarchy of a future structure is created when data are imported into Streamline. Such hierarchy is based on top-down approach i.e. first select a product category, then subcategory etc.

Data "tree" by location

The items in data "tree" can be viewed by location or by item

Data "tree" by item
